

CMSC 143: Object-Oriented Programming with Robots

Lab 11: Predator-Prey Simulation

Due December 10, 2015

Predator-prey simulations are used to understand how populations of animals interact. In this lab's agent-based simulation, there will be two types of animals: Rabbits (prey) and Wolves (predators). Your task is to program the individual animal behaviors. Both types of animals run around randomly and reproduce with some probability. The wolves eat nearby rabbits, removing rabbits from the population. The wolves gain energy from eating the rabbits, but will die if their energy drops to zero. The wolves are born with some energy units and expend energy each timestep. Wolves are less likely to reproduce if their energy is low.

The `Animal` parent class and the `World` class are provided. Your first task is to implement the `Rabbit` and `Wolf` child classes. You **should not** modify the `World` or `Animal` classes. Next, you should run experiments with your simulation. Gather data about how the populations change as you vary one of the parameters: initial population size, speed, movement strategy, reproduction rate. Use `Window()`¹ to plot the data and include the graph along with a brief reflection in your lab report. The `display` attribute can be used to disable drawing each animal, resulting in faster simulations.

Learning Objectives

- Apply Object-Oriented Design
- Use Inheritance
- Create a Simulation

Deliverables

Submit an electronic copy of your lab using moodle. Your program should have your name, email, assignment description, the date, and collaboration statement at the top of the file as a comment. Your submission should be a zip file that expands to a folder with at least these two files:

```
cmsc143-lab11-LASTNAME-FIRSTNAME/  
  lab11.py  -- Your program (only adding Wolf and Rabbit)  
  lab11.pdf -- Your simulation results.
```

¹Either using `savePicture(Picture(w), 'results.png')` or use the `printscrn` button on your keyboard to take a screenshot of your window and then paste that into your report.

```
